

SESSION FILTERING METHOD AND DEVICE

ABSTRACT

A session filtering method and a session filtering device are provided. The method may include: displaying session page entries corresponding to at least a part of communication sessions in which a user at the local end participates via a preset communication application, presentation areas of the session page entries containing filterable labels associated with the corresponding communication sessions; when any filterable label is triggered, filtering a communication session associated with the filterable label from the communication sessions corresponding to the displayed session page entries; and presenting the session page entries corresponding to the filtered communication sessions to the user at the local end. Through the technical solution of this application, a communication session is quickly filtered and found, which is conducive to improve communication efficiency.
