

[Title of Invention] ANALYSIS SYSTEM, ANALYSIS DEVICE,  
ANALYSIS METHOD, AND RECORDING MEDIUM HAVING ANALYSIS  
PROGRAM RECORDED THEREIN

[Document Name] ABSTRACT

An analysis system that obtains data including an encryption key relating to encrypted communications executed between an information communications device and a communications network, from a memory space stored by the information communications device. The analysis system comprises: a memory acquisition unit capable of obtaining at least part of the data stored in the memory unit, from the information communications device having a calculation unit and a memory unit; and a communications processing unit that determines whether or not key data is stored in the memory unit, on the basis of communications data sent and received between the information communications device and the communications network in accordance with an encrypted communications protocol, and instructs the memory acquisition unit to obtain data stored in the memory unit, on the basis of the determination results, said key data including the encryption key used in encryption processing in the encrypted communications protocol.
