Abstract**SEALING GASKET**

G00002

A gasket for providing a seal between a first structural component and second structural component, the gasket being located in a recess in the first structural component, the recess having side walls and a base, the gasket including a lower surface have at least one protuberance thereon to, in use, sealingly engage the base. Extending upwardly and outwardly from the lower surfaces are lower sidewalls, with upper sidewalls extending upwardly or inwardly from the lower sidewalls. The upper sidewalls terminate at a generally planar upper surface. A void extends longitudinally of the gasket and is located between but not contacting the upper surface, the lower surface, the lower sidewalls and the upper sidewalls.
