ABSTRACT

METHOD FOR TRACKING MANAGEMENT AND REAL-TIME DIAGNOSIS AND TREATMENT OF ORAL HEALTH

A method for oral health tracking management and real-time diagnosis and treatment. A tracking diagnosis and treatment method based on color management is established, and comprises: acquiring individual patient visit information and store same as a data set, and establishing a digital form module based on the individual patient visit information data set; extracting, from the data set, feature data that can indicate the individual patient visit information, and establishing correlation analysis between the feature data and different diagnosis and treatment status labels; after different diagnosis and treatment status labels are associated with different feature data, generating different color display; and positioning the feature data associated with the different diagnosis and treatment status labels in specific positions in the digital form module. A doctor can view the diagnosis and treatment status more intuitively, and provide patients with corresponding diagnosis and treatment suggestions, and diagnosis and treatment requirements of the patients are satisfied.
