

ABSTRACT

- 5 "Method for fabricating a heating element by depositing thin layers on an insulating substrate and the element thus obtained"

According to the method:

- 10 - One modifies the surface state of the substrate (1) in order to obtain at least one smooth area (1a)-(1b) of low roughness Ra and at least one area (1c) having a higher roughness Rax;
- One applies a highly electrically conductive material (2) to these various areas (1a), (1b), (1c);
- 15 - One connects smooth area(s) (2a) and (2b) of material (2) to an electrical power source (3).
