

LIQUID CRYSTAL RESIN COMPOSITION

ABSTRACT

Provided is a liquid-crystalline resin composition which has satisfactory moldability and has a low permittivity. The liquid-crystalline resin composition according to the present invention comprises (A) a liquid-crystalline resin and (B) a hollow filler having an aspect ratio of 1.15 or higher. It is preferable that the component (B) be glass balloons. It is preferable that the liquid-crystalline resin composition have a content of component (A) of 60-95 mass% and a content of component (B) of 5-20 mass%. It is preferable that the liquid-crystalline resin composition according to the present invention should further contain (C) a platy filler. It is preferable that the component (C) be mica. It is preferable that the liquid-crystalline resin composition have a content of component (A) of 60 mass% or higher but less than 95 mass%, a content of component (B) of 5-20 mass%, and a content of component (C) higher than 0 mass% but not higher than 20 mass%.
