oo

Claims:

1. An apparatus comprising:

a first curved blade for use in a centrifuge positionable within a wellbore for collecting debris particles in a fluid flowing through the centrifuge, the first curved blade comprising:

a plurality of slots;

a groove positioned at an outer edge of the first curved blade;

a first mating element sized and shaped to mate with a second mating element on a second curved blade for coupling the first curved blade to the second curved blade;

a protrusion on a first surface of the first curved blade; and

a recess on a second surface of the first curved blade for coupling the first curved blade on an additional curved blade in a linear direction, the first surface being on an opposite end of the first curved blade from the second surface.

2. The apparatus of claim 1, wherein the second curved blade includes a plurality of slots and a groove positioned at an outer edge of the second curved blade.

3. The apparatus of claim 2, where the first curved blade is further coupleable to a third curved blade and a fourth curved blade to form the centrifuge.

oo

4. The apparatus of claim 1, wherein a slot of the plurality of eccentric slots intersects with the groove.

5. The apparatus of claim 1, wherein a slot of the plurality of slots of the first curved blade intersects with a slot on the additional curved blade.
