

Abstract

The walking device has a shoe bottom (10) with a midsole (16). A soft heel part (20) is arranged in a recess (18) of the midsole (16) and the outsole (22) has a form that is rounded convexly in the walking direction. The reinforcing element (12), forming an insole, is arranged on the upper surface (44) of the midsole (16) and fastened to it. In the production of the walking device, the upper (14) is joined to the reinforcing element (12) to form a structural unit, which is then mounted on the midsole (16), for example by adhesive bonding.
