(54) Title: INTERSECTING MOTION VECTOR PREDICTION IN VIDEO CODING

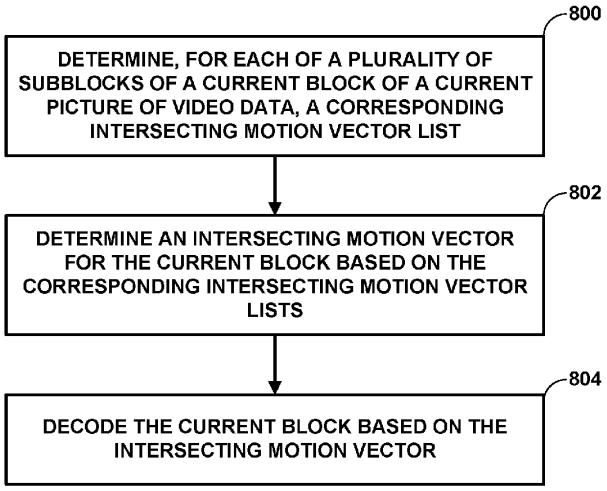

FIG. 18A

(57) Abstract: Example methods, devices, and computer-readable media are described. An example device includes one or more processors configured to determine, for each of a plurality of subblocks of a current block of a current picture of video data, a corresponding intersecting motion vector list. Each corresponding intersecting motion vector list includes at least one intersecting motion vector. The at least one intersecting motion vector includes a source motion vector associated with a first reference picture and a destination motion vector associated with a second reference picture. A source block is located in the first reference picture and has a predictor that is a subset of a destination block located in the second reference picture. The one or more processors are configured to determine an intersecting motion vector for the current block based on the corresponding intersecting motion vector lists and decode the current block based on the intersecting motion vector.
