

ABSTRACT

An object is to provide a method of indirectly replenishing a decreased amount of
5 hyaluronic acid through taking a substance for promoting the production of hyaluronic acid,
other than a method of replenishing a decreased amount of hyaluronic acid by directly orally
taking it. A hyaluronic acid-production promoter containing isoliquiritigenin as an active
ingredient. The hyaluronic acid-production promoter further containing arachidic acid as an
active ingredient. Accordingly, the present invention can be expected to prevent skin aging
10 due to the decrease in hyaluronic acid, as well as improve symptoms associated with the
decrease in hyaluronic acid in other organs where hyaluronic acid is involved.
