
Low-heart Underwear with Linking and Bracing Device

Abstract

A low-heart underwear with linking and bracing device which falls into the category of clothing accessories and lady underwear in particular, which comprises underwear and bra cups; wherein a linking framework is provided at the lower heart position of the underwear to brace the bra cups; the linking framework is in "V" shape or "U" shape; linking holes are provided at the linking end of the said linking framework; the said linking holes link the lower edge of the bra cups and link the lower end of the linking framework and underwear into an entirety. The present invention may lower the heart linking section to the upper abdomen of the dresser; improve the functions of underwear such as corset in bracing, protecting and beautifying ladies' breasts; enable ladies to comfortably wear lower-heart clothing such as low cut dress, open-collar T-shirt and midriff evening dress. As a result, it achieves the visual effect that no underwear is worn, and has the functions of conventional underwear to brace and protect ladies' breasts.
