

DATA ACCESS AUTHORITY MANAGEMENT METHOD, APPARATUS, TERMINAL DEVICE AND STORAGE MEDIUM

ABSTRACT

This application discloses a data access authority management method, apparatus, terminal device and storage medium. The data access authority management method comprises obtaining report metadata in Tableau, the report metadata comprises report ID; creating folder data in Portal platform, the folder data comprises at least one folder, and the folder comprises folder ID; creating a correlation relationship between the report ID and the folder ID in Portal platform; obtaining user class authority configuration request entered by user, the user class authority configuration request comprises user class ID and target folder ID; performing user class authority configuration based on the user class authority configuration request in Portal platform, so as to enable the user class corresponding to the user class ID to have access authority to access report metadata which is corresponded to the report ID corresponding to the target folder ID. The data access management method enables the permission for each report metadata in Tableau Server to be a user class rather than a single user, so as to realize flexible management of access authority to a report in Tableau Server, and extend the application range of Tableau.
