Abstract

[Abstract]
[Problem]

A pharmaceutical composition for treating FGFR4-related cancer, FGF19-related cancer, or FGF19 gene amplification-positive liver cancer is provided.

[Means for Solution]

The present inventors have investigated a compound having an inhibitory action on FGFR4, and found that a specific pyrimidine compound has an inhibitory action on FGFR4 and a pharmaceutical composition having the compound as an active ingredient has an effect of treating FGFR4-related cancer, in another embodiment, FGF19-related cancer, and in still another embodiment, FGF19 gene amplification-positive liver cancer, thereby completing the present invention.
