

DATA TRANSMISSION SYSTEM, TERMINAL DEVICE, PROGRAM, AND
METHOD

ABSTRACT

5 A data transmission system including a plurality of
terminal devices that are connected to a communication
network and that transmit or receive content data among the
terminal devices. At least one of the terminal devices
that receives the content data includes a code amount
10 change requesting unit (12) that, based on an output time
interval of an output signal corresponding to predetermined
content data, transmits a code amount reduction request to
request reduction of a code amount of the predetermined
content data while designating a transmission source of the
15 content data as a destination; and a code amount changing
unit (13) that, in response to a code amount reduction
request transmitted from another terminal device, reduces a
code amount of corresponding content data.
