

Compounds Useful as Kinase Inhibitors

[0001] This invention relates to compounds. More specifically, the invention relates to compounds useful as kinase inhibitors, along with processes to prepare the compounds and uses of the compounds. Specifically, the invention relates to inhibitors of Bruton's tyrosine kinase (BTK).

BACKGROUND

[0002] Kinases are a class of enzyme that control the transfer of phosphate groups from phosphate donor groups, for example ATP, to specific substrates. Protein kinases are a large subset of kinases that play a central role in the regulation of a wide variety of cellular signalling and processes and BTK is one such protein kinase.

[0003] BTK is a member of the src-related Tec family of cytoplasmic tyrosine kinases. BTK plays a key role in the B-cell receptor (BCR) signalling pathway of B-cells, which is required for the development, activation and survival of B-cells. BTK inhibitors have therefore been developed with the aim of treating B-cell malignancies that are dependent on BCR signalling, such as chronic lymphocytic leukemia (CLL) and non-Hodgkin's lymphoma (NHL) (Buggy 2012). BTK is also expressed in specific myeloid cells including, monocytes/ macrophages, neutrophils and mast cells. In these myeloid cells, BTK has been indicated in the immune complex mediated activation of FcγR and FcεR, which is believed to contribute to the pathogenesis of rheumatoid arthritis (RA) (Whang 2014). In addition, BTK is required for the maturation of osteoclast cells and so inhibiting BTK could prevent the bone erosion that is associated with RA. The critical role of BTK in both B-cells and myeloid cells has led to BTK becoming an attractive target for the treatment of not only B-cell malignancies but also for the treatment of autoimmune diseases.

[0004] Ibrutinib is an irreversible BTK inhibitor that has been approved for the treatment of CLL, mantle cell lymphoma (MCL) and Waldenstrom's macroglobulinemia (WM). Since Ibrutinib was first disclosed there have been a number of patent applications concerned with structures closely related to Ibrutinib, for example see WO 2012/158843, WO 2012/158764, WO 2011/153514, WO 2011/046964, US 2010/0254905, US 2010/0144705, US 7718662, WO, 2008/054827 and WO 2008/121742.

[0005] Further Btk inhibitors are disclosed in WO 2013/010136, US 9090621, WO 2015/127310, WO 2015/095099 and US 2014/221333. Kinase inhibitors are also disclosed in US 6660744, US 2002/0156081, US 2003/0225098 and WO 01/19829.

[0006] Ibrutinib also irreversibly binds to interleukin-2 inducible tyrosine kinase (ITK) (Dubovsky 2013). ITK plays a critical role in FcR-stimulated natural killer (NK) cell function that is required for antibody dependent NK cell mediated cytotoxicity (ADCC). ADCC is the mechanism that anti-CD20 antibodies, such as rituximab are believed to activate and ibrutinib has been shown to antagonise this mechanism *in vitro* (Kohrt 2014). As rituximab-combination chemotherapy is today's standard of care in B-cell malignancies, it would be desirable to have a BTK inhibitor with high selectivity for BTK over ITK.

[0007] In the clinic, adverse events have included atrial fibrillation, diarrhea, rash, arthralgia and bleeding (IMBRUVICA package insert 2014). Known BTK inhibitors, e.g. ibrutinib are also known to have gastrointestinal side effects, which are considered to be as a result of a secondary EGFR

inhibitory activity. It is therefore desirable to have a BTK inhibitor with high BTK inhibition and low EGFR inhibition to reduce or avoid the gastrointestinal side effects.

[0008] Irreversible and covalent reversible BTK inhibitors specifically target a cysteine residue C481 within BTK. Following treatment with ibrutinib, cases of primary and secondary resistance have emerged. Mutations within BTK such as C481S, C481Y, C481R, C481F have been reported in the literature and clearly interfere with drug binding (Woyach 2014; Maddocks 2015). It has been predicted that the incidence of observed resistance will increase as clinical use outside clinical trials expands over time (Zhang 2015).

[0009] Therefore, an aim of the present invention is to provide BTK inhibitors with a different binding mode more specifically reversible inhibitors. In addition, the invention aims to provide BTK inhibitors with high selectivity for BTK inhibition over EGFR and ITK inhibition.

[0010] Furthermore, it is an aim of certain embodiments of this invention to provide new cancer treatments. In particular, it is an aim of certain embodiments of this invention to provide compounds which have comparable activity to existing cancer treatments but are also effective against mutations. One of the aspects of the invention focus on providing BTK inhibitors effective against the C481 mutations.

[0011] It is an aim of certain embodiments of this invention to provide compounds which exhibit reduced cytotoxicity relative to prior art compounds and existing therapies.

[0012] Another aim of certain embodiments of this invention is to provide compounds having a convenient pharmacokinetic profile and a suitable duration of action following dosing. A further aim of certain embodiments of this invention is to provide compounds in which the metabolised fragment or fragments of the drug after absorption are GRAS (Generally Regarded As Safe).

[0013] Certain embodiments of the present invention satisfy some or all of the above aims.

DETAILED DESCRIPTION

[00135] Given below are definitions of terms used in this application. Any term not defined herein takes the normal meaning as the skilled person would understand the term.

[00136] The term "halo" refers to one of the halogens, group 17 of the periodic table. In particular the term refers to fluorine, chlorine, bromine and iodine. Preferably, the term refers to fluorine or chlorine.

[00137] The term "alkyl" refers to a linear or branched hydrocarbon chain. For example, the terms "C₁₋₈ alkyl" or "C₁₋₆ alkyl" refer to a linear or branched hydrocarbon chain containing 1, 2, 3, 4, 5 or 6 carbon atoms or 1, 2, 3, 4, 5, 6, 7, or 8 carbon atoms, for example methyl, ethyl, *n*-propyl, *iso*-propyl, *n*-butyl, *sec*-butyl, *tert*-butyl, *n*-pentyl and *n*-hexyl. Alkylene groups may likewise be linear or branched and may have two places of attachment to the remainder of the molecule. Furthermore, an alkylene group may, for example, correspond to one of those alkyl groups listed in this paragraph. The alkyl and alkylene groups may be unsubstituted or substituted by one or more substituents. Possible substituents are described below. - 40

“heterocycloalkenyl” group may be denoted as a “C₃₋₁₀ heterocycloalkenyl”. A “C₃₋₁₀ heterocycloalkenyl” is a ring system containing 3, 4, 5, 6, 7, 8, 9 or 10 atoms at least one being a heteroatom. For example there may be 1, 2 or 3 heteroatoms, optionally 1 or 2. For example, the “C₃₋₈ heterocycloalkenyl” may be tetrahydropyridine, dihydropyran, dihydrofuran, pyrroline, dihydrobenzofuran, dihydrobenzothiophene and indoline.

[00150] The term “aromatic” when applied to a substituent as a whole means a single ring or polycyclic ring system with $4n + 2$ electrons in a conjugated π system within the ring or ring system where all atoms contributing to the conjugated π system are in the same plane.

[00151] The term “aryl” refers to an aromatic hydrocarbon ring system. The ring system has $4n + 2$ electrons in a conjugated π system within a ring where all atoms contributing to the conjugated π system are in the same plane. The ring system may be a single ring or a bi-cyclic or tri-cyclic ring system. For example, the “aryl” may be phenyl and naphthyl. The aryl system itself may be substituted with other groups.

[00152] The term “heteroaryl” refers to an aromatic hydrocarbon ring system with at least one heteroatom within a single ring or within a fused ring system, selected from O, N and S. The ring or ring system has $4n + 2$ electrons in a conjugated π system where all atoms contributing to the conjugated π system are in the same plane. The ring system may be a single ring or a bi-cyclic or tri-cyclic ring system. For example, the “heteroaryl” may be imidazole, thiene, furane, thianthrene, pyrrol, benzimidazole, pyrazole, pyrazine, pyridine, pyrimidine and indole.

[00153] The term “alkaryl” refers to an aryl group, as defined above, bonded to a C₁₋₄ alkyl, where the C₁₋₄ alkyl group provides attachment to the remainder of the molecule.

[00154] The term “alkheteroaryl” refers to a heteroaryl group, as defined above, bonded to a C₁₋₄ alkyl, where the alkyl group provides attachment to the remainder of the molecule.

[00155] The term “halogen” herein includes reference to F, Cl, Br and I. Halogen may be Cl. Halogen may be F.

[00156] A bond terminating in a “” represents that the bond is connected to another atom that is not shown in the structure. A bond terminating inside a cyclic structure and not terminating at an atom of the ring structure represents that the bond may be connected to any of the atoms in the ring structure where allowed by valency.

[00157] Where a moiety is substituted, it may be substituted at any point on the moiety where chemically possible and consistent with atomic valency requirements. The moiety may be substituted by one or more substituents, e.g. 1, 2, 3 or 4 substituents; optionally there are 1 or 2 substituents on a group. Where there are two or more substituents, the substituents may be the same or different. The

- substituent(s) may be selected from: OH, NHR^9 , amidino, guanidino, hydroxyguanidino, formamidino, isothioureido, ureido, mercapto, C(O)H , acyl, acyloxy, carboxy, sulfo, sulfamoyl, carbamoyl, cyano, azo, nitro, halo, C_{1-6} alkyl, C_{1-6} alkoxy, C_{1-6} haloalkyl, C_{3-8} cycloalkyl, C_{2-6} alkenyl, C_{2-6} alkynyl, aryl, heteroaryl or alkaryl. Where the group to be substituted is an alkyl group the substituent may be $=\text{O}$. Where the moiety is substituted with two or more substituents and two of the substituents are adjacent the adjacent substituents may form a C_{4-8} ring along with the atoms of the moiety on which the substituents are substituted, wherein the C_{4-8} ring is a saturated or unsaturated hydrocarbon ring with 4, 5, 6, 7, or 8 carbon atoms or a saturated or unsaturated hydrocarbon ring with 4, 5, 6, 7, or 8 carbon atoms and 1, 2 or 3 heteroatoms.
- 10 **[00158]** If chemically possible to do so, a cyclic substituent may be substituted on a group so as to form a spiro-cycle.
- [00159]** Substituents are only present at positions where they are chemically possible, the person skilled in the art being able to decide (either experimentally or theoretically) without inappropriate effort which substitutions are chemically possible and which are not.
- 15 **[00160]** Ortho, meta and para substitution are well understood terms in the art. For the absence of doubt, "ortho" substitution is a substitution pattern where adjacent carbons possess a substituent, whether a simple group, for example the fluoro group in the example below, or other portions of the molecule, as indicated by the bond ending in "~~~~".

- 20 **[00161]** "Meta" substitution is a substitution pattern where two substituents are on carbons one carbon removed from each other, i.e. with a single carbon atom between the substituted carbons. In other words there is a substituent on the second atom away from the atom with another substituent. For example the groups below are meta substituted.

- 25 **[00162]** "Para" substitution is a substitution pattern where two substituents are on carbons two carbons removed from each other, i.e. with two carbon atoms between the substituted carbons. In other words there is a substituent on the third atom away from the atom with another substituent. For example the groups below are para substituted.

- 30 **[00163]** By "acyl" is meant an organic radical derived from, for example, an organic acid by the removal of the hydroxyl group, e.g. a radical having the formula R-C(O)- , where R may be selected from

H, C₁₋₆ alkyl, C₃₋₈ cycloalkyl, phenyl, benzyl or phenethyl group, eg R is H or C₁₋₃ alkyl. In one embodiment acyl is alkyl-carbonyl. Examples of acyl groups include, but are not limited to, formyl, acetyl, propionyl and butyryl. A particular acyl group is acetyl.

[00164] In embodiments where there is a single enantiomer of the compounds of the invention, the compounds of the invention may have an enantiomeric purity of at least about 90% enantiomeric excess (ee), at least about 95% enantiomeric excess (ee), at least about 98% enantiomeric excess (ee), at least about 99% enantiomeric excess (ee), or 100% enantiomeric excess (ee). In embodiments where there is a mixture of enantiomers of the compounds of the invention, the compounds of the invention may be a racemic mixture or any other mixture of enantiomers, for example the compounds of the invention may have an enantiomeric purity of at least about 50% enantiomeric excess (ee), at least about 60% enantiomeric excess (ee), at least about 70% enantiomeric excess (ee), at least about 80% enantiomeric excess (ee), at least about 90% enantiomeric excess (ee), or at least about 95% enantiomeric excess (ee).

[00165] Throughout the description the disclosure of a compound also encompasses pharmaceutically acceptable salts, solvates and stereoisomers thereof. Where a compound has a stereocentre, both (R) and (S) stereoisomers are contemplated by the invention, equally mixtures of stereoisomers or a racemic mixture are contemplated by the present application. Where a compound of the invention has two or more stereocentres any combination of (R) and (S) stereoisomers is contemplated. The combination of (R) and (S) stereoisomers may result in a diastereomeric mixture or a single diastereoisomer. The compounds of the invention may be present as a single stereoisomer or may be mixtures of stereoisomers, for example racemic mixtures and other enantiomeric mixtures, and diastereomeric mixtures. Where the mixture is a mixture of enantiomers the enantiomeric excess may be any of those disclosed above. Where the compound is a single stereoisomer the compounds may still contain other diastereoisomers or enantiomers as impurities. Hence a single stereoisomer does not necessarily have an enantiomeric excess (e.e.) or diastereomeric excess (d.e.) of 100% but could have an e.e. or d.e. of about at least 85%

[00166] The invention contemplates pharmaceutically acceptable salts of the compounds of formula (I). These may include the acid addition and base salts of the compounds. These may be acid addition and base salts of the compounds. In addition the invention contemplates solvates of the compounds. These may be hydrates or other solvated forms of the compound.

[00167] Suitable acid addition salts are formed from acids which form non-toxic salts. Examples include the acetate, aspartate, benzoate, besylate, bicarbonate/carbonate, bisulfate/sulfate, borate, camsylate, citrate, edisylate, esylate, formate, fumarate, gluceptate, gluconate, glucuronate, hexafluorophosphate, hibenzone, hydrochloride/chloride, hydrobromide/bromide, hydroiodide/iodide, isethionate, lactate, malate, maleate, malonate, mesylate, methylsulfate, naphthylate, 1,5-naphthalenedisulfonate, 2-napsylate, nicotinate, nitrate, orotate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen phosphate, saccharate, stearate, succinate, tartrate, tosylate and trifluoroacetate salts.

[00168] Suitable base salts are formed from bases which form non-toxic salts. Examples include the aluminium, arginine, benzathine, calcium, choline, diethylamine, diolamine, glycine, lysine, magnesium,

meglumine, olamine, potassium, sodium, tromethamine and zinc salts. Hemisalts of acids and bases may also be formed, for example, hemisulfate and hemicalcium salts. For a review on suitable salts, see "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002).

5 **[00169]** Pharmaceutically acceptable salts of compounds of formula (I) may be prepared by one or more of three methods:

- (i) by reacting the compound of formula (I) with the desired acid or base;
- (ii) by removing an acid- or base-labile protecting group from a suitable precursor of the compound of formula (I) or by ring-opening a suitable cyclic precursor, for example, a lactone or lactam, using the
10 desired acid or base; or
- (iii) by converting one salt of the compound of formula (I) to another by reaction with an appropriate acid or base or by means of a suitable ion exchange column.

[00170] All three reactions are typically carried out in solution. The resulting salt may precipitate out and be collected by filtration or may be recovered by evaporation of the solvent. The degree of
15 ionisation in the resulting salt may vary from completely ionised to almost non-ionised.

[00171] The compounds of the invention may exist in both unsolvated and solvated forms. The term 'solvate' is used herein to describe a molecular complex comprising the compound of the invention and a stoichiometric amount of one or more pharmaceutically acceptable solvent molecules, for example, ethanol. The term 'hydrate' is employed when said solvent is water.

20 **[00172]** Included within the scope of the invention are complexes such as clathrates, drug-host inclusion complexes wherein, in contrast to the aforementioned solvates, the drug and host are present in stoichiometric or non-stoichiometric amounts. Also included are complexes of the drug containing two or more organic and/or inorganic components which may be in stoichiometric or non-stoichiometric amounts. The resulting complexes may be ionised, partially ionised, or non- ionised. For a review of
25 such complexes, see J Pharm Sci, 64 (8), 1269-1288 by Haleblian (August 1975).

[00173] Hereinafter all references to compounds of any formula include references to salts, solvates and complexes thereof and to solvates and complexes of salts thereof.

[00174] The compounds of the invention include compounds of a number of formula as herein defined, including all polymorphs and crystal habits thereof, prodrugs and isomers thereof (including
30 optical, geometric and tautomeric isomers) as hereinafter defined and isotopically-labeled compounds of the invention.

[00175] Before purification, the compounds of the present invention may exist as a mixture of enantiomers depending on the synthetic procedure used. The enantiomers can be separated by conventional techniques known in the art. Thus the invention covers individual enantiomers as well as
35 mixtures thereof.

[00176] For some of the steps of the process of preparation of the compounds of formula (I), it may be necessary to protect potential reactive functions that are not wished to react, and to cleave said protecting groups in consequence. In such a case, any compatible protecting radical can be used. In particular methods of protection and deprotection such as those described by T.W. GREENE

(Protective Groups in Organic Synthesis, A. Wiley- Interscience Publication, 1981) or by P. J. Kocienski (Protecting groups, Georg Thieme Verlag, 1994), can be used. All of the above reactions and the preparations of novel starting materials used in the preceding methods are conventional and appropriate reagents and reaction conditions for their performance or preparation as well as procedures for isolating the desired products will be well-known to those skilled in the art with reference to literature precedents and the examples and preparations hereto.

[00177] Also, the compounds of the present invention as well as intermediates for the preparation thereof can be purified according to various well-known methods, such as for example crystallization or chromatography.

[00191] A compound of the invention, or pharmaceutically acceptable salt thereof, may be used on their own but will generally be administered in the form of a pharmaceutical composition in which the compounds of the invention, or pharmaceutically acceptable salt thereof, is in association with a pharmaceutically acceptable adjuvant, diluent or carrier. Conventional procedures for the selection and preparation of suitable pharmaceutical formulations are described in, for example, "Pharmaceuticals - The Science of Dosage Form Designs", M. E. Aulton, Churchill Livingstone, 1988.

[00192] Depending on the mode of administration of the compounds of the invention, the pharmaceutical composition which is used to administer the compounds of the invention will preferably comprise from 0.05 to 99 %w (per cent by weight) compounds of the invention, more preferably from 0.05 to 80 %w compounds of the invention, still more preferably from 0.10 to 70 %w compounds of the invention, and even more preferably from 0.10 to 50 %w compounds of the invention, all percentages by weight being based on total composition.

[00465] Example 204: OCI-Ly10 Anti-proliferative activity

Compounds were assayed for effects on the growth of OCI-Ly10 human DLBCL cells that are dependent on NFκB signalling. OCI-Ly10 cells were grown in suspension in T225 flasks, centrifuged and re-suspended in 2.5% FBS containing media. Cells were then plated at 7.5×10³ cells per well in 96-well plates in varying concentrations of compound and incubated for 72 h at 37 °C. An additional plate of cells to be used as the Day 0 read was seeded without compound addition, Resazurin was added to each well, incubated for 5 h and the fluorescence measured at 590 nm. After 72 h of compound treatment, Resazurin was added to each well of the compound treated plates, incubated for 5 h and the fluorescence measured at 590 nm. The IC₅₀ was then calculated by subtracting the average Day 0 value from each well value from the treated plates, each treatment was then calculated as a percentage of the DMSO control and the percentages plotted against the inhibitor concentration to estimate the IC₅₀ from log[Inhibitor] vs response using the Variable Slope model in Graphpad prism from Graphpad software (SanDiego, Calif).
