

ABSTRACT**WIRELESS COMMUNICATION METHOD AND DEVICE**

5 The embodiments of the present application provide a wireless communication
method and device, being capable of implementing network conversion across systems in a
flexible registration mode of a terminal device. The method comprises: a first network
device in a first system determining a current registration mode of a terminal device and/or
a supported registration mode, the registration mode being a single registration mode
concerning registration in a single system or a dual registration mode concerning
10 registration in a dual system, the terminal device having currently accessed a first cell in the
first system; and the first network device determining, according to the current registration
mode of the terminal device and/or the supported registration mode, a procedure that needs
to be performed or cannot be performed by the terminal device for accessing a second cell
in a second system.
