

[DESCRIPTION]

[Title of Invention]

CARD GAME MONITORING SYSTEM

[Technical Field]

5 [0001]

The present invention relates to a table game monitoring system for a table game using playing cards from a shoe having multiple decks that have been shuffled together prior to the beginning of play in which bettors make wagers on betting areas of a game table in front of the bettors. This table game monitoring system monitors whether or not wagers of winning bettor(s) move to appropriate area of the winner(s).

[Background Art]

[0002]

Baccarat and Black Jack are of the many live table games played in casinos or gaming establishments. These games use a standard deck of 52 playing cards and are usually dealt from a shoe having multiple decks (6 to 9 or 10 decks) that have been shuffled together prior to the beginning of play. When operating people (hereinafter "the dealer") in casinos deliver playing cards to a game table for plays in such games, any loss of cards or exchange of cards between bettors, etc. should not occur, and also wagers with payoffs must correctly go to the winners of the bettors after each game has ended.

[0003]

To assure fair games by preventing such loss or exchanges during games, the game tables in casinos should be administrated so that games at tables are played properly (i.e. there is no exchange of cards or any other accidental or fraudulent acts etc.) and wagers are correctly paid off to the winners. A system to monitor the game tables by camera is known and is disclosed in Patent Literature 1: (US Patent 6,582,301). This known system only monitors the table game and records whole games for later analysis if it is believed that some inappropriate act has occurred.

[Summary of Invention]

[Technical Problem]

[0005]

Embodiments of the present invention provide a real-time monitoring of the table game and enable the casino to stop an ongoing game immediately when something unexpected happens by administrating the whole game from the start to the end of the game.

[0006]

Embodiments of the present invention aim to provide a table game monitoring system with which it is possible to allow a casino to stop an ongoing game immediately when something unexpected happens by administrating the whole game from the start to the end of the game and during payoffs.

[Solution to Problem]

[0007]

According to an aspect of the present invention, there is provided a card game monitoring system for playing a table game, the card game monitoring system comprising: a game table comprising betting areas configured to receive wagers from bettors; a card shooter apparatus associated with the game table, the card shooter apparatus comprising a card reading unit configured to read ranks of cards; a camera system configured to capture an image of positions on the game table to which one or more cards have been delivered from the card shooter apparatus to the bettors; and a control unit configured to determine: 1) a number of betting chips and positions of the betting chips by performing an image analysis of the image, 2) for each bettor, whether or not the bettor receives more than two cards from the card shooter apparatus, 3) each hand of the bettors and a dealer based on a combination of information of the ranks of the cards read by the card shooter apparatus and the positions of cards captured by the camera

system, and 4) after each game has ended and based on one or more winning hands determined by the control unit, whether a collection of the wagers to a chip tray on the game table is correct.

[0007a]

According to another aspect of the present invention, there is provided a card game monitoring system for a game, the card game monitoring system comprising: a game table comprising betting areas, the betting areas including, for each bettor, a banker hand betting area and a player hand betting area; a card shooter apparatus associated with the game table and configured to read ranks of cards dealt from the card shooter apparatus; a monitor camera system configured to capture an image of wagers placed on the game table by each bettor; and a control unit configured to: perform an image analysis of the image to identify one or more positions within the image at which the wagers are located; determine whether a banker hand or a player hand is a winning hand according to a game rule based on information of the ranks of the cards read by the card shooter apparatus; and after each game has ended, check whether a collection of the wagers to a chip tray on the game table is correct in accordance with the identified one or more positions.

[0007b]

According to another aspect of the present invention, there is provided a card game monitoring system for playing a table game, the card game monitoring system comprising: an electronic dealing shoe associated with a gaming table, the electronic dealing shoe comprising a card reader unit configured to determine, for each card of a plurality of cards dealt from the electronic dealing shoe, a rank and a suit of the card and to generate first information indicating the ranks and the suits of the plurality of cards dealt from the electronic dealing shoe; and a control unit configured to: receive image information from a camera system indicating the positions on the game table to which the camera system has captured the plurality of cards to have been dealt; generate second information indicating positions of the plurality of cards dealt from the electronic dealing shoe and wagers on each betting area at the game table based on the image information, the generation of the second information including

performing an image analysis of an image of the image information output by the camera system to identify one or more positions within the image at which the wagers are located to thereby determine respective ones of n at the game table on which the wagers have been placed; determine each hand of a dealer and one or more bettors based on a combination of the first information indicating the rank and the suit of the plurality of cards and the second information indicating the positions of the plurality of cards; and after each game has ended and based on an indication of one or more bettors as winners having a winning hand, determine whether a collection of the wagers to a chip tray on the game table is correct.

[0007c]

There is also disclosed a card game monitoring system having: a game table on which bettors make wagers on betting areas, a card shooter apparatus that is put on the game table and has a card reading unit that reads the number (rank) of the card and having a control unit to determine a winning hand according to a table game rules based on information of numbers of the cards sequentially read by the card reading unit and a monitor video camera system to capture positions of the card delivered from the card shooter apparatus to bettors and identify wagers on each betting area at the game table, the control unit has a processing function using the information of the monitor video camera system to determine: 1) head-count of the bettors playing each game by identifying the wagers on each betting area or cards delivered to bettors, 2) whether or

not each bettor gets more than two cards from the card shooter apparatus, 3)
each hand of the bettors and the dealer according to the information read by
the card shooter apparatus using the information of head-count of the bettors
according to the game rule, and 4) the winner(s) having the winning hand(s)
5 in the game according to the game rule based on the information of the each
hand of the bettors and the dealer, wherein the monitor video camera system
further reads movements of wagers on the game table, and the control unit
having further processing function to check whether wagers with payoffs
move to the winner of the bettor determined by the card shooter apparatus at
10 the end of each game.

[0008]

In the card game monitoring system, the control unit has further processing
function to identify ranks of playing cards on the game table delivered by a
dealer and to check and report whether ranks of cards are the same as the
15 ones determined by the card shooter apparatus.

[Brief Description of Drawings]

[0009]

[Fig. 1]

Fig. 1 is a diagram schematically showing the entirety of a table game system
20 according to an embodiment 1 of the present invention.

[Fig. 2]

Fig. 2 is a diagram schematically showing the entirety of a table game system
according to an embodiment 2 of the present invention.

[Description of Embodiments]

25 [0010]

Embodiment 1 of the present invention will be described with reference to the
attached drawings. Embodiment 1 of the present invention provides a card
game monitoring system for playing Black Jack. In Fig. 1, the card game
monitoring system has: a game table 1 on which bettors 2 make wagers by
30 putting wagers 3 on betting areas 4; a card shooter apparatus that is put on
the game table 1 and has a card reading unit that reads the number (rank)

and suit of the cards 6 and having a control unit 7 to determine a winning hand according to a table game rule based on information of numbers (ranks) of the cards sequentially read by the card reading unit 5.

[0011]

5 A monitor video camera system 8 which has several cameras 9 is set above each game table 1 to capture the positions of cards 6 delivered from the card shooter apparatus 5 to bettors 2. The monitor video camera system 8 identifies wagers 3 on each betting area 4 at the game table 1, the control unit 10 has a processing function using the information of the monitor video
10 cameras 9 to determine the following:

1) head-count of the bettors playing on each game by identifying the positions of wagers on each betting area or cards delivered to each bettor 2 (three persons (heads) shown in fig.1) ,

2) number of cards delivered for each bettor 2 by dealer 11 from the card
15 shooter apparatus 5 (whether or not each bettor 2 gets more than two cards).
[0012]

The control unit 10 has further processing function using information from the monitor video cameras 9 to determine each hand of the bettors 2 and the dealer 11 according to the information read by the card shooter apparatus 5
20 using the information of the results of head-counting of the bettors 2 and according to the game rules installed in the control unit 7 of the card shooter apparatus 5. Then the control unit 7 will determine the winner W having the winning hand on the game based on the information of the hands of the bettors 2 and the dealer 11.

25 [0013]

Wherein the card shooter apparatus 5 knows directions of each card (who gets each card read by the card shooter apparatus 5 through the monitor video camera system 8) and then the card shooter apparatus 5 (the control unit 7) will figure out by its programs the hands held by the bettors 2 and the dealer
30 11. The control unit 10 has further a processing function to check whether wagers 3 with payoffs 3W move to a pool 12 of the winner 2W of the bettors 2

determined by the card shooter apparatus 5 at the end of each game (the movement M for the winners and L for loser in fig.1).

[0014]

The monitor video camera system 8 (with the control unit 10) has further
5 processing function that identify ranks of playing cards 6 by analyzing
pictures from the monitor video cameras 9 to determine each hand (number)
of the bettors 2 on the game table delivered by a dealer 11 and checks
whether suits and ranks of cards 6 are the same as the ones read and
determined by the card shooter apparatus 5.

10 [0015]

The monitor video camera system 8 (the control unit 10) has further
processing function that identifies total amounts of wagers 3 by counting
chips on each betting area 4 of the bettors 2. Each total amount of wagers 3
are calculated by analyzing pictures from the monitor video cameras 9 of its
15 colors and its height of chips on each betting areas 4. Special video cameras 9s
for this purpose may be put around the game table 1 to take side views of the
chips of wagers 3.

[0016]

Fig. 2 shows an example of Embodiment 2 of the present invention.

20 Embodiment 2 of the present invention provides a card game monitoring
system for playing game (Baccarat). In Fig. 2, the card game monitoring
system has: a game table 21 on which bettors 2 make wagers by putting
wagers 3 on betting areas 24; a card shooter apparatus 25 that is put on the
game table 21 and has a card reading unit that reads the number (rank) and
25 suit of the cards 6 and having a control unit 27 to determine a winning hand
according to a table game rule based on information of numbers (ranks) of the
cards 6 sequentially read by the card shooter apparatus 25.

[0017]

A monitor video camera system 28 reads cards and movements of the wagers
30 3 on the game table. The control unit 27 of the card shooter apparatus 25 has
processing functions to determine whether the winning hand is the Banker or

the Player based on information of numbers (ranks) of the cards read by the a card shooter apparatus 25 and Baccarat game rule in the control unit 27. A control unit 30 of the card game monitoring system having processing function to check whether wagers 3 with payoffs 3W move to a pool 22 of the winners 2W of the bettors 2 after each game has ended.

[0018]

Wherein the card shooter apparatus 25 knows that place (Banker or Player) to which each card is delivered according to the game rule of Baccarat and then the card shooter apparatus 25 (with the control unit 27) will calculate each hand of Banker and Player. In this way the card shooter apparatus 25 determines whether a winning hand is the Banker or the Player. The control unit 30 has a further processing function to check whether wagers 3 with payoffs 3W move to a pool 22 of the winner 2W of the bettors 2 determined by the card shooter apparatus 25 at the end of each game (the movement M for the winners and L for loser movement M in fig.2).

[0019]

The monitor video camera system 28 (with the control unit 30) has further processing function that identify ranks of playing cards 6 on the game table 21 delivered by a dealer 11 by analyzing pictures obtained from the monitor video cameras 29. This card game monitoring system checks whether suits and ranks of cards 6 are the same as the ones read and determined by the card shooter apparatus 25 and reports to an administration section of the casino the results of whether the suits and ranks of cards 6 are the same as those delivered and read by the card shooter apparatus 25.

[0020]

The monitor video camera system 28 (the control unit 30) has further processing function that identify total amounts of wagers 3 by counting chips on each betting area 24 of the bettors 2. Each total amount of wagers 3 is calculated by analyzing pictures from the monitor video cameras 29 of its colors and its height of chips on each betting areas 24. Special video cameras 29s for this purpose may be put around the game table 21 to take side views

of the chips of wagers 3.

[0021]

In both examples of Embodiment 1 and 2 the monitor video camera system 8 and 28 can identify positions of wagers 3, the total amount of wagers 3 of its
5 colors and its height of chips on each betting areas 4 and 24 by analyzing pictures taken by the video cameras 9, 9s, 29 and 29s using CCD and through known technology of vision analysis. The monitor video camera system 8 and 28 can also identify positions of cards 3 and analyze the faces of cards showing in betting.

10 [0022]

Throughout this specification and the claims which follow, unless the context requires otherwise, the word "comprise", and variations such as "comprises" and "comprising", will be understood to imply the inclusion of a stated integer or step or group of integers or steps but not the exclusion of any other integer
15 or step or group of integers or steps.

[Annex 1]

[0023]

The card game monitoring system mentioned above, the card shooter apparatus has further determination function of the card games when each
20 game starts and ends according to the rules of Baccarat or Black Jack with monitoring video camera system.

[Annex 2]

[0024]

The card game monitoring system mentioned above, the control unit has
25 further processing function to check whether wagers do not move from the original betting position to the other area during the each game starts and ends (during each game).

[Annex 3]

[0025]

30 The card game monitoring system mentioned above, the control unit has a determination function to determine when the betting starts before the start

of each game (the betting start indicates the time the first bet is put on the betting area).

[Annex 4]

[0026]

- 5 The card game monitoring system mentioned above, the control unit has a determination function to determine when the betting ends before the start of each game (the betting end indicates the time the first card is delivered from the card shooter apparatus). Also the control unit has a processing function using the information from the monitor video camera system to determine the
10 movement of the dealer's hand representing the end of betting called "No more bet".

[Annex 5]

[0027]

- The card game monitoring system mentioned above, the control unit has a
15 determination function to determine when the payoff has completed after the end of each game.

[Annex 6]

[0028]

- The card game monitoring system mentioned above, the control unit has a
20 transmitting function to transmit the information of the monitor video camera to a backyard in casino.

[Annex 7]

[0029]

- The card game monitoring system mentioned above, the control unit has a
25 determination function to determine an error, and the card game monitoring system further has an output means to output an error signal by displaying and/or alarming in the card shooter apparatus and/or the related system components incorporated in the card game monitoring system as a result of the determination of the error. The error mentioned above includes at least
30 one of the following items.

- 1) The ranks of playing cards identified by the card game monitoring system

on the game table delivered by the dealer are not same as the ones determined by the card shooter apparatus.

2) Wagers have moved from the original betting position to other areas during each game.

5 3) Wagers with payoffs have not moved to the winners of the bettors at the end of each game.

[Annex 8]

[0030]

The card game monitoring system mentioned above, the control unit has a
10 determination function to identify a cut card delivered from the card shooter apparatus.

[CLAIMS]

1. A card game monitoring system for playing a table game, the card game monitoring system comprising:

5 a game table comprising betting areas configured to receive wagers from bettors;

a card shooter apparatus associated with the game table, the card shooter apparatus comprising a card reading unit configured to read ranks of cards;

10 a camera system configured to capture an image of positions on the game table to which one or more cards have been delivered from the card shooter apparatus to the bettors; and

a control unit configured to determine:

15 1) a number of betting chips and positions of the betting chips by performing an image analysis of the image,

2) for each bettor, whether or not the bettor receives more than two cards from the card shooter apparatus,

20 3) each hand of the bettors and a dealer based on a combination of information of the ranks of the cards read by the card shooter apparatus and the positions of cards captured by the camera system, and

4) after each game has ended and based on one or more winning hands determined by the control unit, whether a collection of the wagers to a chip tray on the game table is correct.

25

2. The card game monitoring system according to claim 1, wherein the control unit is further configured to identify the ranks of the cards on the game table delivered by the dealer and configured to check and report whether the ranks of cards identified by the control unit are the same as the ranks read by the card shooter apparatus.

30

3. The card game monitoring system according to claim 1, wherein the card shooter apparatus is further configured to determine when each game starts and ends.

5 4. The card game monitoring system according to claim 3, wherein the control unit is further configured to check whether the wagers move from a first betting position in a particular betting area to another betting area of the game table during each game.

10 5. A card game monitoring system for a game, the card game monitoring system comprising:
a game table comprising betting areas, the betting areas including, for each bettor, a banker hand betting area and a player hand betting area;
a card shooter apparatus associated with the game table and
15 configured to read ranks of cards dealt from the card shooter apparatus;
a monitor camera system configured to capture an image of wagers placed on the game table by each bettor; and
a control unit configured to:
perform an image analysis of the image to identify one or
20 more positions within the image at which the wagers are located;
determine whether a banker hand or a player hand is a winning hand according to a game rule based on information of the ranks of the cards read by the card shooter apparatus; and
after each game has ended, check whether a collection of the
25 wagers to a chip tray on the game table is correct in accordance with the identified one or more positions.

6. The card game monitoring system according to claim 5, wherein the control unit is further configured to identify the ranks of the cards on the
30 game table delivered by a dealer and configured to check and report whether the ranks of cards identified by the control unit are the same as the ranks

read by the card shooter apparatus.

7. The card game monitoring system according to claim 5, wherein the card shooter apparatus is further configured to determine when each game starts and ends.

8. The card game monitoring system according to claim 7, wherein the control unit is further configured to check, during each game, whether a particular wager of the wagers moves from a first position in a particular betting area to a second position in another area of the game table.

9. The card game monitoring system according to claim 1, wherein: the camera system is further configured to identify directions of movements of the wagers on the game table, and the control unit is configured to check whether the wagers with payoffs move to one or more winners of the bettors determined by the card shooter apparatus at an end of each game based on the identified directions of movements of the wagers.

10. The card game monitoring system according to claim 1, wherein the card shooter apparatus is configured to be coupled to the game table.

11. The card game monitoring system according to claim 10, wherein card shooter apparatus configured to be coupled to game table is positioned on the game table.

12. The card game monitoring system according to claim 5, wherein the card shooter apparatus is configured to deliver the cards to the game table.

13. A card game monitoring system for playing a table game, the card game monitoring system comprising:

an electronic dealing shoe associated with a gaming table, the electronic dealing shoe comprising a card reader unit configured to determine, for each card of a plurality of cards dealt from the electronic dealing shoe, a rank and a suit of the card and to generate first information indicating the ranks and the suits of the plurality of cards dealt from the electronic dealing shoe; and

a control unit configured to:

receive image information from a camera system indicating the positions on the game table to which the camera system has captured the plurality of cards to have been dealt;

generate second information indicating positions of the plurality of cards dealt from the electronic dealing shoe and wagers on each betting area at the game table based on the image information, the generation of the second information including performing an image analysis of an image of the image information output by the camera system to identify one or more positions within the image at which the wagers are located to thereby determine respective ones of n at the game table on which the wagers have been placed;

determine each hand of a dealer and one or more bettors based on a combination of the first information indicating the rank and the suit of the plurality of cards and the second information indicating the positions of the plurality of cards; and

after each game has ended and based on an indication of one or more bettors as winners having a winning hand, determine whether a collection of the wagers to a chip tray on the game table is correct.

14. The card game monitoring system according to claim 13, wherein the control unit is further configured to identify the wagers with payoffs and the wagers without payoffs based on the winners and based on the wagers on

each betting area at the game table.

15. The card game monitoring system according to claim 13, wherein the control unit is further configured to:

- 5 identify the ranks of the plurality of cards on the game table; and
 verify whether the ranks of cards identified by the control unit are
the same as the ranks determined by the card reading unit.

16. The card game monitoring system according to claim 13, further
10 comprising the camera system including one or more cameras configured to
capture one or more images of the game table, generate the image
information based on the one or more images, and send the image information
to the control unit.

15 17. The card game monitoring system according to claim 13, further
comprising means for outputting an error signal responsive to a
determination that either a particular wager with a payoff did not move to a
particular winner or that a particular wager without payoffs move to the
dealer.

20

18. The card game monitoring system according to claim 13, wherein the
electronic dealing shoe is configured to deliver the cards to the game table.

19. The card game monitoring system according to claim 13, wherein the
25 electronic dealing shoe is configured to be coupled to the game table.

20. The card game monitoring system according to claim 19, wherein
electronic dealing shoe configured to be coupled to the game table is
positioned directly on the game table.

30

21. The card game monitoring system according to claim 1, wherein the

control unit is further configured to determine the one or more winning hands according to a table game rule.

22. The card game monitoring system according to claim 1, wherein the
5 control unit is further configured to determine the one or more winning hands based on the determined each hand of the bettors and the dealer.

23. The card game monitoring system according to claim 1, wherein the
10 control unit is distinct from the card shooter apparatus.

24. The card game monitoring system according to claim 13, wherein the control unit is further configured to determine, based on determined hands of the dealer and the one or more bettors, each hand of the one or more bettors as a winning hand or a losing hand according to game rules.
