

ABSTRACT

A method for determining an initial access bandwidth part is performed by a first terminal which determines a first initial access bandwidth part on the basis of a first rule, wherein the first initial access bandwidth part does not exceed the access bandwidth capacity of a first terminal, and the access bandwidth capacity of the first terminal is lower than that of a second terminal; the second terminal determines, on the basis of a second rule, a second initial access bandwidth part according to RMSI; the first rule and the second rule are not completely the same or completely different.
