(54) Title: BODY-WEARABLE MEDICAL DEVICE COMPRISING A SEALING ELEMENT

Fig. 1

(57) Abstract: The present invention relates to a body-wearable medical device comprising a first housing portion and a second housing portion, the first housing portion having a female portion and the second housing portion having a male portion, the male portion is at least partially inserted into the female portion thereby defining a circumferential clearance gap, wherein a circumferential sealing element is arranged in the circumferential clearance gap between the female portion and the male portion. In order to provide a body-wearable medical device comprising an improved sealing that is less prone to failure by stress and forces exerting on the body-wearable medical device, the female portion and the male portion are fixed to each other by a circumferential fixation glue that is arranged in the circumferential clearance gap between the female portion and the male portion next to the circumferential sealing element.
