ABSTRACT OF THE DISCLOSURE

An image pickup device displays, on a finder image area, an index mark indicating the wide angle side and the telephoto side of the zooming operations, an index mark indicating the zoom angle setting range in combination with the corresponding focal lengths, and an index mark indicating the current set position. When the photographer watches a desired position of the index mark, the viewpoint is detected by the viewpoint detecting device and the zooming operation is automatically conducted to the focal length corresponding to the viewpoint.
