

ABSTRACT

Disclosed is a data sharing method, which includes the following steps: when a searching request sent from a first client is received, a server acquiring a searching parameter corresponding to the searching request, searching in a preset database based on the searching parameter; verifying the permission of the first client based on the first blacklist information; and when the verification of the permission of the first client is passed, sending the first blacklist information to the first client. The present disclosure also provides a data sharing device and a computer-readable storage medium. The data gathering process of the first client is omitted when sharing the blacklist information, the sharing process of the blacklist information is further simplified, and the sharing efficiency of the blacklist information is improved.
