

DEVICE AND METHOD FOR FACILITATING A PROVISION OF A CONTENT

ABSTRACT

A device and method for facilitating a provision of a content is disclosed. The device for facilitating the provision of the content may comprise a processor operable to detect a temporal location of a first content; and an output unit operable to output a second content associated with the first content, to be synchronised with the first content outputted, wherein the processor is operable to extract a first identifier associated with the temporal location of the first content outputted, match the first identifier against one or more identifiers of the second content, and use a temporal location associated with a second identifier matched with the first identifier to synchronise the output of the second content with the first content outputted.
