

ABSTRACT
BARBECUE/COOKING STOVE

A barbecue/cooking stove comprises an electrical heating device including an electric outer heating member for heating an annular barbecue area of a disc and an electric inner heating member for heating a central cooking area of the disc. The heating device further comprises a connector device having plural slots for mounting the ends of the heating members, thereby providing uniform and synchronous heating to both of the barbecue area and the cooking area. Plural ribs are formed on an upper side of the disc that extends radially outward and downward from the central cooking area. A dripping hole is defined in the disc for guiding grease into a grease-collecting cup that can be removed for disposal of grease.
