COMMUNICATION METHOD, APPARATUS, AND SYSTEM, AND STORAGE MEDIUM

ABSTRACT

This application provides a communication method, apparatus, and system, and a storage medium. The method includes: obtaining information about a first network identifier corresponding to a first network index; obtaining a first multicast/broadcast service control channel MCCH message; and determining, based on the information about the first network identifier corresponding to the first network index, information about an identifier of a first broadcast service included in the first MCCH message, where both the first network index and the first MCCH message are associated with a secondary cell SCell or a primary secondary cell group cell PSCell,, so that an identifier of a broadcast service that is in an MCCH message of the SCell or the PSCell and that is indicated by the network index can be obtained through parsing based on the information about the network identifier, to perform broadcast service matching.
