ABSTRACT

IMAGE RECORDING AND REPRODUCING DEVICE

An image recording and reproducing device (1) for monitor is composed of a plurality of CCTVs (2), a recording/reproducing controller (3) which receives image signals from the CCTVs (2), and a video monitor which reproduces and displays recorded images. The controller (3) is provided with a large-capacity recording circuit (34) incorporating a phase change optical disk as a recording medium. On the recording medium, image information is recorded and stored together with the names of the stations which sent the images and the times when the images are sent from the stations. When the name of a station and the time are designated, a required image is easily reproduced and displayed.
