ABSTRACT

The present disclosure provides a data interaction method, a system, a readable storage medium, and an electronic device. The method comprises: receiving a service instruction; generating backup data based on the service instruction; receiving service data transmitted by a first hardware domain; respectively verifying the service data and the backup data to obtain a first verification result and a second verification result; determining whether a preset data transmission condition is currently satisfied based on the first verification result and the second verification result; and in a case where the data transmission condition is satisfied, determining target data from the service data and the backup data based on the first verification result and the second verification result, and transmitting the target data to a second hardware domain.
