## ABSTRACT

### CLAMPING ARRANGEMENT FOR A COMPACT DISC OR THE LIKE

A clamping arrangement clamps a compact disc (5) or the like in position on a rotary support. The clamping arrangement comprises a clamp member (2) and guide means (36, 38). The clamp member (2) cooperates with the guide means (36, 38) and is movable relative to the guide means (36, 38). The clamp member (2) has a first position in which the clamp member (2) causes the compact disc (5) or the like to be clamped in position on the rotary support. The clamp member (2) also has a second non-clamping position in which the compact disc (5) or the like is unclamped and may be removed from the rotary support. Movement of the clamp member (2) relative to the guide means (36, 38) causes the movement of the clamp member (2) between the first and second positions. The guide means (36, 38) retains the clamp member (2) in a clamped position when in the first position.
