

COMMUNICATION DEVICE, COMMUNICATION CONTROL METHOD, AND  
PROGRAM

ABSTRACT

5

[Object] To enable the communication device that has received a response frame to determine whether or not the response frame is a signal of the own BSS, while ensuring downward compatibility.

[Solution]        Provided is a communication device including: a generation unit  
10 configured to generate a response frame prescribed in IEEE802.11 by setting a value corresponding to a BSS to which the own device belongs in a receiving station address field of the response frame; and a transmission unit configured to transmit the response frame.
