

ELECTRICAL POWER SUPPLY APPARATUS
OF AIR CONDITION CONTROL MACHINE

ABSTRACT

An air condition control unit is provided with an EEPROM previously memorizing respectively different specific numbers on indoor control units. Provided thereto are power supply judging means for judging whether a remote controller receives the power from another indoor control unit by monitoring power source lines, power not-supply determining means for determining the unit of its own to be a unit which does not supply the power to the remote controller when the power supply judging means judges the remote controller receives the power, and power supply determining means for determining the unit of its own to be a unit which supplies the power to the remote controller when the power supply judging means judges the remote controller to be in a state that no power is supplied thereto at the power supply timing based on the specific number.
