Remote communication terminal for trading on the exchange markets

Abstract

The invention relates to the systems for assistance in financial transactions. The terminal for trading on the exchange markets, comprising a monitor and a keyboard or a monitor with a keyboard on a monitor screen, a device providing transfer of funds to user's account and/or write-off of funds from the user's account and/or money output, a device for remote connection in the form of the programming and computing unit having a feature of displaying of the graphic interface with the fields for displaying of target information, connected with the control server for the user's account state. The device providing transfer of funds to the user's account and/or write-off of funds from the user's account and/or money output, produced in the form of a unit built into the terminal case, or located outside the latter at a distance and connected with the programming and computing unit having a feature of remote connection with the servers of the exchange markets and information agencies for displaying in the specified fields of information about the current quotations, stakes and calculation of profit and loss for each transaction, thus the specified unit also has a feature of displaying of stakes and with a feature of input of the price for a rate (point) change and a stake amount through the keyboard.
