

GRAPH DATA QUERY METHODS, APPARATUSES, AND DEVICES

ABSTRACT

Embodiments of this specification disclose graph data query methods, apparatuses, and devices. The methods include: receiving a query request for graph data; determining a search start node in the graph data; searching, starting from the search start node and along an edge in the graph data, the graph data for a target node that meets the query request; determining, based on query data that need to be returned in response to the query request, whether the target node needs to be materialized; and if no, returning corresponding query data when the target node does not need to be materialized.
