

METHOD, APPARATUS, AND DEVICE FOR PROCESSING BLOCKCHAIN DATA

ABSTRACT

5 A method, an apparatus, and a device for processing blockchain data are disclosed in embodiments of the present specification. The method is applied to a terminal device provided with a trusted execution environment (TEE), including: acquiring data to be verified of a target service from a blockchain, the data to be verified including circulation data generated during execution of the target service and recorded in the blockchain; determining, based on the target service, a relevant third-
10 party authority for verifying authenticity of the data to be verified, and acquiring benchmark circulation data generated during the execution of the target service and recorded in the third-party authority; transferring the data to be verified and the benchmark circulation data to the TEE through a first trusted application on the terminal device, wherein the TEE is provided with a verification rule for performing data verification on the data to be verified; and determining whether the data to be
15 verified meets the verification rule by using the trusted execution environment and based on the circulation data in the data to be verified and the benchmark circulation data, and outputting a verification result of the data to be verified.
