

ABSTRACT

This application discloses an interface display method, apparatus, terminal, and storage medium, and belongs to the field of computer and Internet technologies. The method includes: displaying a display picture corresponding to a virtual environment and a target operation control; displaying an indication graph of the target operation in the display picture in response to a touch operation for the target operation control; and marking, in response to a hittable virtual object in the effective range of the target operation, the hittable virtual object in a map display control. This solution implements visualization of the hittable virtual object corresponding to the target operation in the map display control, greatly reduces resource consumption of the terminal, and improves a running speed of a game. Sliding operations of a user on the display picture when attacking a hostile virtual object outside the screen display picture are reduced. The operation is simple and has high timeliness. The user can directly obtain an influence target of the target operation by using the map display control, reducing a probability of an operation error of the target operation, and ensuring the accuracy of the target operation.
