

ABSTRACT

INSPECTION SYSTEM, AND INFORMATION PROCESSING MACHINE

5

An inspection system includes a cycle monitoring device (28) to be mounted on a vehicle together with a refrigeration cycle device (26) to acquire operation status information indicating an operation status of the refrigeration cycle device and transmit the operation status
10 information to outside. The inspection system includes an information processing machine (50) arranged outside the vehicle to receive the operation status information from the cycle monitoring device and to inspect presence or absence of an abnormality in the refrigeration cycle device based on the operation status information. The information
15 processing machine includes an information storage unit (52) that stores the operation status information, an information calculation unit (53) and an information communication unit (51). The information calculation unit generates inspection data for inspecting the presence or absence of an abnormality in the refrigeration cycle device based on
20 the operation status information stored in the information storage unit, stores the inspection data in the information storage unit and inspects the presence or absence of an abnormality in the refrigeration cycle device by comparing the inspection data with a reference data. The information communication unit transmits an inspection result regarding
25 the presence or absence of an abnormality in the refrigeration cycle device to a predetermined information terminal (60).
