

ABSTRACT (FIG. 5)

"HALL DESTINATION CONTROLLER"

According to one embodiment, a hall destination
controller (20) includes a scan unit (21) and a control
5 unit (22). The scan unit (21) scans a two-dimensional
code. The control unit (22) determines whether the
two-dimensional code scanned by the scan unit (21) is a
two-dimensional code for data settings or a two-
dimensional code for call registration. The control
10 unit (22) changes, when the two-dimensional code
scanned by the scan unit (21) is a two-dimensional code
for data settings, settings of the hall destination
controller (20) by using the two-dimensional code for
data settings. The control unit (22) generates, when
15 the two-dimensional code scanned by the scan unit (21)
is a two-dimensional code for call registration, a hall
call by using the two-dimensional code for call
registration.
