

ABSTRACT

BRACELET WITH LINKS MADE OF
RIGID MATERIAL ON A FLEXIBLE CORE

The bracelet (1) is formed of several juxtaposed links (2) made of rigid material and a flexible core (3) onto which the links are threaded. The flexible core (3) is formed over a part of its length of flexible elements (4) removably assembled one after the other. Each flexible element comprises on two opposite sides a first assembling
5 portion (7) and a second assembling portion (6) complementary to the first assembling portion. The elements can be assembled one after the other by fitting the first and second assembling portions together to form a flexible strip. The links (2) are positioned on the flexible core to hold the flexible elements in their assembled position.
