

ABSTRACT

A video recording method and device, an electronic device and a storage medium are provided. By acquiring (S101) speed varying information of a speed-varied video, where the speed varying information is used to represent a playing speed change of the speed-varied video; performing (S102) reverse speed-varying processing on the speed-varied video according to the speed varying information to obtain an original speed video; displaying (S103) the original speed video, and synchronously performing video shooting to generate an original speed target video; and performing (S104) speed varying processing on the original speed target video according to the speed varying information to obtain a target speed-varied video, since a playing speed of the original speed video obtained by reverse speed varying is the same as a normal speed of a video recorded by a user, by displaying the original speed video to the user to guide the user to record the video, a special effect in a template can be matched with video content shot by the user, so that the special effect in the original speed-varied video is directly available for the video recorded by the user, thereby solving the problem that the video special effect does not match the video content, and improving the special effect performance of the video recorded by the user.
