

ABSTRACT

There is provides a biological condition determining apparatus (100) for determining a biological condition of a subject on a bed. A biological condition determining apparatus (100) includes a plurality of load detectors (11, 12, 13, 14) which are placed in the bed or under feet of the bed and which detect a load of the subject, a biological information extracting unit (31) which extracts biological information from an output of the load detector, a determining unit (32) which determines the biological condition of the subject by comparing the extracted biological information with a referential information prepared beforehand, and an output unit (5) which outputs the biological condition of the subject determined by the determining unit.
