A DIGITAL INFORMATION SIGNAL REPRODUCING APPARATUS

A digital information signal reproducing apparatus is provided, in which a relative speed between a record medium (1) in which a digital information signal is recorded and a reproducing device (2, 3) for reproducing the digital information signal from the record medium (1) is selectively changed. Even when the multiple of an over-sampling digital filter (4, 5) is switched in response to the switching of the relative speed, the frequency characteristic of an analog low-pass filter (9, 10) need not be changed, and thus the circuit arrangement of this digital information signal reproducing apparatus can be simplified.
