

ABSTRACT

An equipment and method to implement the adaptive functions of communication protocols are provided so that the smart card operation system can adaptively select the corresponding communication protocol according to that of the terminal. The equipment includes: a communication protocol setting module; a communication protocol detecting module; a communication protocol selecting module. The method includes: setting communication protocol for the smart card operation system; judging whether the communication protocol type of the smart card operation system is identical with that of the terminal; if not identical, selecting communication protocol for the smart card operation system. Therefore, the communication protocol of the smart card operation system can be adaptively selected according to the protocol of the terminal.
