

ABSTRACT

The present disclosure provides a method and apparatus for mounting a file system, a device, and a storage medium, relating to the field of computer technologies, and in particular to the field of network file systems. The method includes: detecting whether a
5 mount request obtained from a client includes a target token; if the target token is included, querying a target authorization record associated with the target token from candidate authorization records of candidate file systems, where the target authorization record includes a target identifier of the target file system; and feeding back the target
10 identifier to the client, enabling the client to access the target file system using the target identifier.
