

ACCOUNT SETTLEMENT METHOD, STORAGE MEDIUM, AND COMPUTER SYSTEM

ABSTRACT

Embodiments of this specification disclose an account settlement method, a storage medium, and a computer system. Pending amounts and pending expense amounts are determined based on pending account vouchers generated when transaction amounts respectively recorded by a business platform and a business execution institution are reconciled; a pending income amount and a pending expense amount matching each other are determined from the pending amounts and the pending expense amounts, to obtain a to-be-settled amount group; and then an account settlement instruction is generated based on pending account vouchers corresponding to the to-be-settled amount group, to clear the pending account vouchers based on the account settlement instruction. According to the automated amount matching solution, labor costs of account settlement are reduced and efficiency of settling a huge amount of pending data is improved, thereby reducing an in-transit fund risk for a business entity.
