

ABSTRACT

COMMUNICATION APPARATUS, COMMUNICATION METHOD, AND PROGRAM

When a communication apparatus that can execute authentication that uses a Wi-Fi Protected Access (WPA)2 method and authentication that uses a WPA3 method performs communication with another communication apparatus in a state in which a link is established with the other communication apparatus via a plurality of frequency channels, the communication apparatus executes authentication using the WPA3 method based on at least one frequency channel of the plurality of frequency channels being a frequency channel included in a specific frequency band.
