

ABSTRACT

A restroom management device 1 configured to recommend a restroom stall that can be more comfortably used by a user includes a restroom stall usage frequency determination unit 110 and an amenity usage status determination unit 120, and thus
5 decides a recommended restroom stall 21X in consideration of not only usage frequencies of restroom stalls but also usage statuses of amenities therein. Even a restroom stall with a low usage frequency that is kept cleaner may not be selected as the recommended restroom stall 21X if the availability of its amenity is low. Therefore, the user can use a
10 restroom stall that is kept cleaner because of a low usage frequency and in addition, offers higher availability of its amenity.
