

ABSTRACT
PRODUCTION OF VIRUS VECTOR PLASMID IN BACILLUS SUBTILIS

5 The present disclosure pertains to production of a virus
vector plasmid in *Bacillus subtilis*. According to one aspect,
the present disclosure provides a method for producing a
virus vector plasmid having a sequence to be replicated in
10 *Bacillus subtilis*. The method includes a step for forming a
plasmid in a host cell by introducing, into the host cell,
a nucleic acid that has a sequence to be replicated in
Bacillus subtilis and that includes a nucleic acid sequence
for producing a virus vector. In one embodiment, *Bacillus*
subtilis could have the ability to form a plasmid from a
nucleic acid acquired from outside, and therefore, in
this method, the nucleic acid introduced dose not have
be a plasmid.
