Abstract

Arrangement, plug-in mount and contact element for fixing and contacting switching assemblies on a substrate

The contact elements (7) of a plug-in mount (1) are connected in an electrically conducting manner to conductive contact zones (34) on a surface of a substrate (3) after the plug-in mount (1) has been loaded with a switching assembly (2) and are electrically isolated from the signal lines (32) in the unloaded state, so that higher clock rates for the signals transmitted on the signal lines (32) are made possible in not completely expanded systems with empty mounting locations.
