

Description

Technical field

The present invention relates to packaging various articles such as groups of beverage bottles, cans, or boxes with heat shrinkable plastic film.

Background art

Such packaging with heat shrinkable plastic film is relatively easily done at commercially acceptable speeds by automatic machines. The packages formed are economical, aesthetically pleasing and insure a purchaser that the package has not previously been opened.

Such packages do, however, need a handle to facilitate handling the package. The prior art has attempted to solve this problem by forming a harness around the package or by adhering a handle to it as with a pressure sensitive adhesive, or by cutting slots beside reinforced seam portions of the package after it is heat shrunk around the articles (see French Patent Publication No. 2,136,030 which discloses a method according to the first part of claim 1). Such attaching of a handle, however, has required an additional operation after the wrapping operation, and such cutting of slots has not provided easy access to the portion of the seam that then provides the handle i.e. the handle is not necessarily positioned in the most convenient position.

Disclosure of the invention

The present invention provides a method for forming packages with shrinkable film that has a handle by which the packages can be manipulated without requiring any additional operations on the packaging line in addition to the normal operations by which the heat shrinkable plastic film is applied and shrunk, which handle is strongly attached to the film, is well positioned and is easily accessible to a person wishing to carry the package.

According to the present invention there is provided a method for packaging at least one article in heat shrinkable film while forming at least one handle for carrying the resultant package, said method comprising the steps of:

bonding a length of tape along its entire length to a sheet of heat shrinkable material;

wrapping the article in the sheet of heat shrinkable material with the central portion of the tape at a location relative to the article at which the handle is desired;

sealing two opposite ends of the sheet together; and

heating the sealed sheet to a temperature sufficient to shrink the sheet onto the article;

characterized by the step of: weakening portions of the sheet along central portions of the longitudinal edges of the tape prior to the step of heating the sealed sheet so that the heating of the sealed sheet causes the weakened portions of the sheet to form openings along the central portion of the tape which then provides the handle and

wherein the bonded tape is positioned on one of the exterior or interior of the sheet.

To adapt the method according to the present invention to production machinery it can further include providing a continuous strip of heat shrinkable material; bonding lengths of tape to the strip at spaced intervals to provide the bonding step; weakening portions of the strip along each of the lengths of tape to provide the weakening step; and cutting away a portion of the strip including one of the lengths of tape for use in the wrapping, sealing and heating steps.

The weakened areas along the central portion of the tape may be created by perforating, or by cutting, or by thinning the heat shrinkable sheet which may be done, for example, by pressing a heated blade against it or by imprinting dark lines on the heat shrinkable sheet which will be preferentially heated by the radiation that shrinks the film as is described in the French Patent No. 1,314,184.

The tape may be bonded to the heat shrinkable sheet by any convenient means, but preferably is bonded by an appropriate adhesive, such as a pressure sensitive adhesive, by heat sealing or by ultrasonic welding.

The present invention also provides a packaging sheet of heat shrinkable plastic adapted to be applied as a package for at least one article, and having at least one length of tape bonded to said sheet, characterized in that said tape is bonded to only one surface of the sheet, and in that said heat shrinkable sheet is weakened along central portions of the longitudinal edges of the tape. Preferably the sheet of shrinkable plastic is selected from the group consisting of polyolefins, biaxially-oriented polyvinylchloride and polyester; the tape backing is made of material selected from the group consisting of natural and synthetic fabrics, polyester, polypropylene, fiber reinforced film, stabilized polyvinylchloride, kraft paper, and reinforced cardboard; and the tape is bonded to the film with an adhesive.

Also provided by the present invention is a package comprising at least one article, a sheet of heat shrunk polymeric material around the article, a length of tape bonded to the polymeric material, and openings in the heat shrunk polymeric material along a central portion of the tape so that the central portions of the tape adjacent the openings provide a handle for the package, characterized in that the length of tape is bonded to only one of the inside or outside surfaces of the polymeric material with respect to the package.

If desired, a package made according to the invention may have two handles (or more) located, for instance, on its two opposite top ends or on its two opposite sides, or diagonally across and crossed on the middle of its top surface.

If desired, end portions of the tape on each side of the central portion of the tape that provides handles, may go practically entirely around the package which may be necessary for relatively heavy packages.

The tape may be attached to either the inside or

the outside of the heat shrinkable sheet with respect to the package, and may be used as printing location, for instance, for advertising purposes. Also, two lengths of tape may be attached opposite each other on the inside and the outside of the heat shrinkable sheet.

The application of the length of tape to the sheet of heat shrinkable film and the weakening of the film along the central portion of the tape may be easily done by automatic packaging machines using methods well known by those skilled in the art, particularly in the field of label application.

The close association between the tape handle and the packaging sheet ensures an excellent resistance to tensile and shearing forces.

Moreover, the formation of access openings for the handle from weakened lines by heat-shrinking the sheet restricts the formation of stress concentration notches along the edges defining the opening which can occur when an opening is cut into such film after it is heat shrunk.

Brief description of the drawing

The present invention will be further described with reference to the accompanying drawing wherein like numbers refer to like parts in the several views, and wherein:

Figure 1 is a perspective view of a first embodiment of a package made according to the present invention;

Figure 2 is a top view of the package of Figure 1;

Figure 3, 4 and 5 are top views of second, third and fourth embodiments of packages made according to the present invention;

Figure 6 is a fragmentary plan view of a packaging laminate according to the present invention;

Figure 7 is a schematic view in perspective illustrating a method for manufacturing a second embodiment of a packaging laminate according to the present invention; and

Figure 8 is a schematic view in perspective illustrating a method according to the present invention for applying the packaging laminate of Figure 7 to form packages according to the present invention.

Detailed description

Referring now to Figures 1 and 2, there is illustrated a package 1 according to the present invention containing six bottles, such as bottles of mineral water.

These six bottles are grouped and packed in a heat shrunk plastic sheet 2, such as a sheet of polyethylene of the type currently used for such packages.

At the middle of the package 1 is attached a length of tape 3, a central portion of which extends across the top of the package 1 and provides a handle 4 for the package 1, and the end parts 5 of which fix the handle 4 to the sheet 2. For most applications it is preferable that the tape 3 be made of a material that is relatively non-heat-shrinkable compared to the plastic sheet 2 before

it is shrunk around the bottles when both the tape 3 and the sheet 2 are exposed to the temperatures at which the sheet 2 is normally shrunk.

On each side of the central portion of the length of tape 3 the heat shrunk sheet 2 has access openings 6 and 7 which allow a user's hand to grasp the handle 4.

As an example, one heat shrinkable plastic sheet material that can be used to form the package 1 is that sold under the commercial designation "Polyethylene, Film Lineaire 80 microns" by the French company REMY. Thermal treatment of this sheet material is 230—250 degrees C for about 6 seconds with hot air or by infra-red radiation causes it to shrink approximately 60 percent lengthwise of the sheet and 20 percent widthwise of the sheet. Thus it is advantageous, for most applications with this sheet, to arrange lengths of tape to be used as handles transversely to the length of such sheet material, however, the expected result in accordance to the present invention can also be obtained by arranging those lengths of tape in other orientations with respect to the length of such sheet material.

To package 6 plastic bottles of 1.5 to 2 liters of the type currently used for mineral water, a sheet size of 420 mm wide and having an appropriate length could be used.

Suitable materials to be used for the tape 3 include non-stretchable pressure sensitive adhesive coated tapes such as, for example, the tape reinforced with glass filaments running along its length sold by Minnesota Mining and Manufacturing Company (3M), Saint Paul, Minnesota under the trade designation "Scotch Brand Filament Tape 898", or the tape sold by 3M under the trade designation "Scotch Brand Tape No. 351" which has a polyester film backing. Stretchable pressure sensitive adhesive coated tapes are also usable and may be preferred for some uses because of their shock absorbing properties. An example of such a stretchable tape is the tape having a polypropylene backing sold by 3M under the trade designation "8459 Scotch Brand Film Tape." The example tapes listed above are coated with rubber-resin adhesives which adhere very well to polyethylene sheet material.

A second embodiment of a package according to the present invention is illustrated in Figure 3 enclosing six bottles, and includes two lengths of tape forming handles 8, 9 having respectively on their two sides openings 10, 11, 12 and 13.

In a third embodiment of a package according to the present invention illustrated in Figure 4, only one tape handle 14 is attached at a diagonal; whereas in a fourth embodiment shown in Figure 5 two tape handles 15, 16 are attached crosswise with their central portions forming a single handle with two openings 17, 18 at its sides.

Figure 6 illustrates a packaging laminate according to the present invention including a heat shrinkable polymeric packaging film 19 having adhered to it at equally spaced intervals, transverse lengths of tape 20, and linear weakened portions 21 and 22 of the film 19 along

10

central portions of the longitudinal edges of the tape 20.

The film 19 can be cut into equal pieces generally along the lines 23 and 24 and have the pieces applied around one or more objects by a standard packaging machine to form packages generally of the type shown in Figures 1 and 2.

The weakened lines 21, 22 may consist of perforations spaced from each other by approximately 2 to 3 millimeters, or incisions about 3 to 5 millimeters long spaced from each other by approximately 1 to 2 millimeters.

To package six bottles of mineral water containing 1.5 to 2 liters each, an adhesive tape 20 which is 25 millimeters wide and 40 to 45 centimeters long may be used. The weakened lines 21 and 22 may each be of about 10 centimeters long which makes a good length for the handle. The shrinking of the polyethylene film after the standard sealing of its ends may be done in approximately 6 seconds at 250 degrees C, such as in a heat shrinking force air oven of the type sold by the French Company TERMELEC S.A. The resultant packages will each have two halfmoon shaped openings each about 10 centimeters long and 5 to 7 centimeters wide which are located on opposite sides of the handle provided by a central portion of the length of tape 20.

Figures 7 and 8 sequentially illustrate a method according to the present invention for packaging at least one article 36 in heat shrinkable film 26 while forming at least one handle 43 for carrying the resultant package 44. Figure 7 illustrates forming a packaging laminate according to the present invention and Figure 8 illustrates forming packages according to the present invention using the packaging laminate made by the method shown in Figure 7.

As is shown in Figure 7, a rolled supply length 27 of pressure sensitive adhesive coated tape 28 is cut into desired lengths 32 by a knife 30 and the lengths 32 of the tape 28 are then applied at equal intervals along a sheet of heat shrinkable polymeric material from a supply roll 25 by a roller 29, while two toothed wheels 31 are pressed against the film 26 to make two perforated lines 33 located on opposite sides of the lengths 32 of tape, and only along the future handles 43 to be formed by the central portions of the lengths 32 of the tape 43. The resultant packaging laminate 34 according to the invention is then wound into a roll 35 for storage or for direct use to form packages by the further method steps illustrated in Figure 8.

As illustrated in Figure 8, the packaging laminate 34 (including lengths 32 of tape adhered in spaced relationship along heat shrinkable film 26 and edged along their central portions with perforated lines 33 though the film 26) is wrapped around an article 36 to be packed so that one length 32 of tape will be positioned across the top of the package with its central portion at a desired location for the handle 43 to be formed. The laminate 34 wrapping around the article 36 is then sealed at 39 and simultaneously cut by a pair of

thermo cutters 38. The assembly is then submitted to heat radiation 40 which causes the shrinking of the film 26 onto the article 36 and the formation of openings 41 and 42 at each side along the central portion of the length 32 of tape to form the handle 43 for the package 44.

As an example, the machines sold by 3M (USA) under the trade designation "3 Applicator No. T-645H" could be used to apply the lengths of tape on the heat shrinkable film and the single or double track bundling machines sold by the companies DOBOY (France) and KISTERS (Switzerland) could be used for forming the packages.

It will be understood by those skilled in the art that the present invention is not limited to the embodiments described above, but could be modified in many ways depending on the desired application without departing from the spirit of the invention. For example, the tape 28 applied in the method illustrated in Figure 7 could be applied in a continuous length along the sheet 26 and could then be cut by the thermo cutters 38 along with the film 26.

Thus the scope of the present invention should not be limited to the structure described in the specification, but only to the structures recited in the claims.

Claims

1. A method for packaging at least one article in heat shrinkable film while forming at least one handle for carrying the resultant package, said method comprising the steps of:

bonding a length of tape (32) along its entire length to a sheet (26) of heat shrinkable material; wrapping the article (36) in the sheet (26) of heat shrinkable material with the central portion of the tape at a location relative to the article at which the handle is desired;

sealing two opposite ends (39) of the sheet together; and

heating the sealed sheet to a temperature sufficient to shrink the sheet onto the article;

characterized by the step of: weakening portions (33) of the sheet (26) along central portions of the longitudinal edges of the tape prior to the step of heating the sealed sheet so that the heating of the sealed sheet causes the weakened portions of the sheet to form openings (41, 42) along the central portion of the tape which then provides the handle and wherein the bonded tape is positioned on one of the exterior or interior of the sheet.

2. A method according to claim 1 wherein said method further comprises providing a continuous strip (26) of heat shrinkable material; bonding lengths of tape (32) to the strip at spaced intervals to provide said bonding step, weakening portions (33) of the strip along each of the lengths of tape to provide said weakening step; and cutting away a portion of the strip including one of the lengths of tape for use in said wrapping, sealing and heating steps.

3. A method according to claim 1 wherein said

central portions of the longitudinal edges of the tape 20.

The film 19 can be cut into equal pieces generally along the lines 23 and 24 and have the pieces applied around one or more objects by a standard packaging machine to form packages generally of the type shown in Figures 1 and 2.

The weakened lines 21, 22 may consist of perforations spaced from each other by approximately 2 to 3 millimeters, or incisions about 3 to 5 millimeters long spaced from each other by approximately 1 to 2 millimeters.

To package six bottles of mineral water containing 1.5 to 2 liters each, an adhesive tape 20 which is 25 millimeters wide and 40 to 45 centimeters long may be used. The weakened lines 21 and 22 may each be of about 10 centimeters long which makes a good length for the handle. The shrinking of the polyethylene film after the standard sealing of its ends may be done in approximately 6 seconds at 250 degrees C, such as in a heat shrinking force air oven of the type sold by the French Company TERMELEC S.A. The resultant packages will each have two halfmoon shaped openings each about 10 centimeters long and 5 to 7 centimeters wide which are located on opposite sides of the handle provided by a central portion of the length of tape 20.

Figures 7 and 8 sequentially illustrate a method according to the present invention for packaging at least one article 36 in heat shrinkable film 26 while forming at least one handle 43 for carrying the resultant package 44. Figure 7 illustrates forming a packaging laminate according to the present invention and Figure 8 illustrates forming packages according to the present invention using the packaging laminate made by the method shown in Figure 7.

As is shown in Figure 7, a rolled supply length 27 of pressure sensitive adhesive coated tape 28 is cut into desired lengths 32 by a knife 30 and the lengths 32 of the tape 28 are then applied at equal intervals along a sheet of heat shrinkable polymeric material from a supply roll 25 by a roller 29, while two toothed wheels 31 are pressed against the film 26 to make two perforated lines 33 located on opposite sides of the lengths 32 of tape, and only along the future handles 43 to be formed by the central portions of the lengths 32 of the tape 43. The resultant packaging laminate 34 according to the invention is then wound into a roll 35 for storage or for direct use to form packages by the further method steps illustrated in Figure 8.

As illustrated in Figure 8, the packaging laminate 34 (including lengths 32 of tape adhered in spaced relationship along heat shrinkable film 26 and edged along their central portions with perforated lines 33 though the film 26) is wrapped around an article 36 to be packed so that one length 32 of tape will be positioned across the top of the package with its central portion at a desired location for the handle 43 to be formed. The laminate 34 wrapping around the article 36 is then sealed at 39 and simultaneously cut by a pair of

thermo cutters 38. The assembly is then submitted to heat radiation 40 which causes the shrinking of the film 26 onto the article 36 and the formation of openings 41 and 42 at each side along the central portion of the length 32 of tape to form the handle 43 for the package 44.

As an example, the machines sold by 3M (USA) under the trade designation "3 Applicator No. T-645H" could be used to apply the lengths of tape on the heat shrinkable film and the single or double track bundling machines sold by the companies DOBOY (France) and KISTERS (Switzerland) could be used for forming the packages.

It will be understood by those skilled in the art that the present invention is not limited to the embodiments described above, but could be modified in many ways depending on the desired application without departing from the spirit of the invention. For example, the tape 28 applied in the method illustrated in Figure 7 could be applied in a continuous length along the sheet 26 and could then be cut by the thermo cutters 38 along with the film 26.

Thus the scope of the present invention should not be limited to the structure described in the specification, but only to the structures recited in the claims.

Claims

1. A method for packaging at least one article in heat shrinkable film while forming at least one handle for carrying the resultant package, said method comprising the steps of:

bonding a length of tape (32) along its entire length to a sheet (26) of heat shrinkable material; wrapping the article (36) in the sheet (26) of heat shrinkable material with the central portion of the tape at a location relative to the article at which the handle is desired;

sealing two opposite ends (39) of the sheet together; and

heating the sealed sheet to a temperature sufficient to shrink the sheet onto the article;

characterized by the step of: weakening portions (33) of the sheet (26) along central portions of the longitudinal edges of the tape prior to the step of heating the sealed sheet so that the heating of the sealed sheet causes the weakened portions of the sheet to form openings (41, 42) along the central portion of the tape which then provides the handle and wherein the bonded tape is positioned on one of the exterior or interior of the sheet.

2. A method according to claim 1 wherein said method further comprises providing a continuous strip (26) of heat shrinkable material; bonding lengths of tape (32) to the strip at spaced intervals to provide said bonding step, weakening portions (33) of the strip along each of the lengths of tape to provide said weakening step; and cutting away a portion of the strip including one of the lengths of tape for use in said wrapping, sealing and heating steps.

3. A method according to claim 1 wherein said

weakening step comprises perforating the sheet of heat shrinkable material.

4. A method according to claim 1 wherein said weakening step comprises cutting the sheet of heat shrinkable material.

5. A method according to claim 1 wherein said weakening step comprises thinning the sheet of heat shrinkable material.

6. A method according to any preceding claim wherein said bonding step comprises bonding the tape to the heat shrinkable sheet with an adhesive.

7. A method according to any preceding claim wherein said wrapping step further comprises defining a longitudinal axis of the article; and locating the tape (32) at an oblique angle relative to the longitudinal axis of the article.

8. A method according to any of claims 1 to 6 wherein said wrapping step further comprises defining a longitudinal axis of the article; and locating the tape (32) transversely to the longitudinal axis of the article.

9. A method according to any preceding claim wherein the bonding step further comprises the step of bonding a second length of the tape along its entire length to the sheet of heat shrinkable material so as to intersect the first length of the tape bonded to the sheet.

10. A method according to any of claims 1 to 8 wherein the bonding step further comprises the step of bonding a second length of the tape along its entire length to the sheet of heat shrinkable material parallel to the first length of tape bonded to the sheet.

11. A packaging sheet of heat shrinkable plastic adapted to be applied as a package for at least one article, and having at least one length of tape (20) bonded to said sheet (19), characterized in that said tape is bonded to only one surface of the sheet, and in that said heat shrinkable sheet (19) is weakened along central portions (21, 22) of the longitudinal edges of the tape 20.

12. A package sheet according to claim 11 wherein said sheet (19) of heat shrinkable plastic is selected from the group consisting of polyolefines, biaxially-oriented polyvinylchloride and polyester; the tape (20) is made of material selected from the group consisting of natural and synthetic fabrics, polyester, polypropylene, fiber reinforced film, stabilized polyvinylchloride, kraft paper, and reinforced cardboard; and the tape is bonded to the sheet with an adhesive.

13. A package comprising at least one article, a sheet (2) of heat shrunk polymeric material around the article, a length of tape (3) bonded to the polymeric material, and openings (6, 7) in the heat shrunk polymeric material along a central portion of the tape so that the central portions of the tape adjacent the openings provide a handle (4) for the package, characterized in that the length of tape is bonded to only one of the inside or outside surfaces of the polymeric material with respect to the package.

Patentansprüche

1. Verfahren zum Verpacken mindestens eines Gegenstandes in einer wärmeschrumpfbaren Folie unter Bildung mindestens eines Handgriffs zum Tragen der erhaltenen Packung, mit folgenden Schritten:

eine Länge eines Streifens (32) wird über seine ganze Länge an ein Blatt (26) aus wärmeschrumpfbarem Material angeklebt;

der Gegenstand (36) mit dem Blatt (26) aus wärmeschrumpfbarem Material derart umwickelt, daß sich der mittlere Teil des Streifens relativ zu dem Gegenstand an einer Stelle befindet, an der der Handgriff erwünscht ist;

die einander entgegengesetzten Enden (39) des Blattes werden aneinander angesiegelt; und

das gesiegelte Blatt wird auf eine solche Temperatur erhitzt, daß das Blatt auf den Gegenstand aufgeschrumpft wird,

dadurch gekennzeichnet, daß vor dem Erhitzen des gesiegelten Blattes Teile (33) des Blattes (36) längs zentraler Teile der Längsränder des Streifens derart geschwächt werden, daß infolge des Erhitzens des gesiegelten Blattes die geschwächten Teile des Blattes Öffnungen (41, 42) bilden, die längs des zentralen Teils des Streifens Öffnungen (41, 42) so angeordnet sind, daß dieser den Handgriff bildet und der angeklebte Streifen sich auf der Außen- oder Innenseite des Blattes befindet.

2. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß ein endloses Band (26) aus wärmeschrumpfbarem Material verwendet wird, daß in dem Klebeschritt Längen eines Streifens (32) aus wärmeschrumpfbarem Material in im Abstand voneinander angeordneten Bereichen des Bandes an dieses angeklebt werden, daß in dem Schwächungsschritt längs jeder der Längen des Streifens Teile (33) des Bandes geschwächt werden und daß für die Verwendung in dem Umwickel-, Siegel- und Erhitzungsschritt ein Teil mit einer der Längen des Streifens versehener Teil des Bandes abgeschnitten wird.

3. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß in dem Schwächungsschritt das Blatt aus wärmeschrumpfbarem Material perforiert wird.

4. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß in dem Schwächungsschritt das Blatt aus wärmeschrumpfbarem Material geschnitten wird.

5. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß in dem Schwächungsschritt das Blatt aus wärmeschrumpfbarem Material dünner gemacht wird.

6. Verfahren nach Anspruch 1, dadurch gekennzeichnet, daß in dem Klebeschritt der Streifen mit einem Klebstoff an das wärmeschrumpfbare Blatt angeklebt wird.

7. Verfahren nach einem der vorhergehenden Ansprüche, dadurch gekennzeichnet, daß in dem Umwickelschritt

eine Längsachse des Gegenstandes bestimmt und

der Streifen (32) unter einem schrägen Winkel zu der Längsachse des Gegenstandes angeordnet wird.

8. Verfahren nach einem der Ansprüche 1 bis 6, dadurch gekennzeichnet, daß in dem Umwickelschritt

eine Längsachse des Gegenstandes bestimmt und

der Streifen (32) quer zu der Längsachse des Gegenstandes angeordnet wird.

9. Verfahren nach einem der vorhergehenden Ansprüche, dadurch gekennzeichnet, daß in dem Klebeschritt eine zweite Länge des Streifens an dem Blatt aus wärmeschrumpfbarem Material über dessen ganze Länge derart angeklebt wird, daß die zweite Länge des Streifens die erste mit dem Blatt verklebte Länge des Streifens kreuzt.

10. Verfahren nach einem der Ansprüche 1 bis 8, dadurch gekennzeichnet, daß in dem Klebeschritt eine zweite Länge des Streifens mit dem Blatt aus wärmeschrumpfbarem Material über dessen ganze Länge derart verklebt wird, daß sich der zweite Streifen parallel zu der an dem Blatt angeklebten, ersten Länge des Streifens erstreckt.

11. Verpackungsblatt, das aus einem wärmeschrumpfbaren Kunststoff besteht und als Verpackung für mindestens eines Gegenstandes verwendbar ist, mit mindestens einer mit dem Blatt (19) verklebten Länge eines Streifens (20), dadurch gekennzeichnet, daß der Streifen nur an einer Oberfläche des Blattes angeklebt ist und daß das wärmeschrumpfbare Material (29) längs zentraler Teile (21, 23) der Längsränder des Streifens (20) geschwächt ist.

12. Verpackungsblatt nach Anspruch 11, dadurch gekennzeichnet, daß das Blatt (19) aus wärmeschrumpfbarem Kunststoff aus einem Material besteht, das aus der Gruppe ausgewählt ist, die aus Polyolefinen, biaxial orientiertem Polyvinylchlorid und Polyestern besteht, daß der Streifen (20) aus einem Material besteht, das aus der Gruppe ausgewählt ist, die aus Textilstoffen aus natürlichen und Kunstfasern besteht, ferner aus Polyester, Polypropylen, faserverstärkter Feinfolie, stabilisiertem Polyvinylchlorid, Kraftpapier und verstärkter Pappe, und daß der Streifen mit einem Klebstoff an dem Blatt angeklebt ist.

13. Packung mit mindestens einem Gegenstand, einem den Gegenstand umgebenden Blatt (2) aus wärmeschrumpfbarem polymeren Material, einer mit dem polymeren Material verklebten Länge eines Streifens (3) und in dem wärmeschrumpfbaren polymeren Material längs eines zentralen Teils vorgesehenen Öffnungen (6, 7), so daß die den Öffnungen benachbarten, zentralen Teile des Streifens einen Handgriff (4) für die Packung bilden, dadurch gekennzeichnet, daß die Länge des Streifens an dem polymeren Material nur auf einer Fläche angeklebt ist, die die Innen- oder Außenfläche des polymeren Materials bildet.

Revendications

1. Procédé d'emballage d'au moins un objet

dans un film thermorétractable, tout en formant au moins une poignée permettant de porter le paquet résultant, ce procédé comprenant les phases suivantes:

la liaison d'une certaine longueur de bande (32) suivant la totalité de sa longueur sur une feuille (26) d'une matière thermorétractable;

l'enveloppement de l'objet (36) dans la feuille (26) de matière thermorétractable, de manière que la partie centrale de la bande se trouve en un endroit, par rapport à l'objet, où on désire la poignée;

le scellage ensemble des deux extrémités opposées (39) de la feuille; et

le chauffage de la feuille scellée jusqu'à une température suffisante pour provoquer la rétraction de cette feuille sur l'objet,

caractérisé par la phase suivante: l'affaiblissement de portions (33) de la feuille (26) le long de parties centrales des bords longitudinaux de la bande avant la phase de chauffage de la feuille scellée, de manière que le chauffage de cette feuille scellée amène les parties affaiblies de la feuille à former des ouvertures (41, 42) le long de la partie centrale de la bande, qui forme ensuite la poignée, la bande liée étant disposée sur l'extérieur ou sur l'intérieur de la feuille.

2. Procédé suivant la revendication 1, caractérisé en ce qu'il comprend en outre la prévision d'un ruban continu (26) de matière thermorétractable, la liaison de longueurs de bande (32) au ruban à des intervalles espacés pour assurer la phase de liaison susdite, l'affaiblissement de parties (33) du ruban le long de chacune des longueurs de bande pour provoquer la phase susdite d'affaiblissement, et l'enlèvement par découpage d'une partie du ruban, comprenant une des longueurs de bande en vue de l'utilisation dans les phases susdites d'enveloppement, de scellage et de chauffage.

3. Procédé suivant la revendication 1, caractérisé en ce que la phase d'affaiblissement comprend une perforation de la feuille de matière thermorétractable.

4. Procédé suivant la revendication 1, caractérisé en ce que la phase d'affaiblissement comprend un découpage de la feuille de matière thermorétractable.

5. Procédé suivant la revendication 1, caractérisé en ce que la phase d'affaiblissement comprend un amincissement de la feuille de matière thermorétractable.

6. Procédé suivant l'une quelconque des revendications précédentes, caractérisé en ce que la phase de liaison comprend la liaison de la bande à la feuille thermorétractable grâce à un adhésif.

7. Procédé suivant l'une quelconque des revendications précédentes, dans lequel la phase d'enveloppement comprend en outre:

la définition d'un axe longitudinal de l'objet; et la localisation de la bande (32) suivant un angle oblique par rapport à l'axe longitudinal de l'objet.

8. Procédé suivant l'une quelconque des revendications 1 à 6, caractérisé en ce que la phase d'enveloppement comprend en outre:

la définition d'un axe longitudinal de l'objet;
et

la localisation de la bande (32) transversalement à l'axe longitudinal de cet objet.

9. Procédé suivant l'une quelconque des revendications précédentes, caractérisé en ce que la phase de liaison comprend en outre l'opération de liaison d'une seconde longueur de la bande suivant la totalité de sa longueur à la feuille de matière thermorétractable, de manière à recouper la première longueur de la bande liée à cette feuille.

10. Procédé suivant l'une quelconque des revendications 1 à 8, caractérisé en ce que la phase de liaison comprend en outre l'opération de liaison d'une seconde longueur de la bande, suivant la totalité de sa longueur, à la feuille de matière thermorétractable parallèlement à la première longueur de bande liée à la feuille.

11. Feuille d'emballage de matière plastique thermorétractable, destinée à être appliquée à titre d'emballage d'au moins un objet, et comportant une longueur de bande (20) liée à la feuille (19), caractérisée en ce que cette bande est liée à une seule surface de la feuille, et en ce que la feuille thermorétractable (19) est affaiblie le long de parties cen-

trales (21, 22) des bords longitudinaux de la bande (20).

12. Feuille d'emballage suivant la revendication 11, caractérisée en ce que la feuille (19) de matière plastique thermorétractable est choisie dans le groupe comprenant les polyoléfinés, le chlorure de polyvinyle orienté biaxialement et les polyesters, la bande (20) est faite d'une matière choisie dans le groupe comprenant les tissus naturels et synthétiques, les polyesters, le polypropylène, les films renforcés par fibres, le chlorure de polyvinyle stabilisé, un papier kraft, et un carton renforcé, et en ce que la bande est liée à la feuille par un adhésif.

13. Paquet comprenant au moins un objet, une feuille (2) de matière polymère rétractée à chaud entourant cet objet, une longueur de bande (3) liée à la matière polymère, et des ouvertures (6, 7) pratiquées dans la matière polymère rétractée à chaud le long d'une partie centrale de la bande, de manière que les parties centrales de cette bande, voisines des ouvertures, forment une poignée (4) pour l'emballage, caractérisé en ce que la longueur de bande est liée à une seule des surfaces intérieure ou extérieure de la matière polymère par rapport à l'emballage.
