

REIMBURSEMENT CODE–BASED DATA PROCESSING METHOD AND APPARATUS

ABSTRACT

Embodiments of this specification provide a reimbursement code–based data
5 processing method and apparatus. A reimbursement code–based data processing
method includes: performing expense control verification on a target order of an
institution member based on an expense control rule configured in a reimbursement
code of an institution; paying, if expense control verification succeeds, for the target
order based on an institution account bound to the institution, to obtain bill
10 information; transferring the bill information to a ticket application link activated by
an order participant, to generate an electronic ticket of the target order; and creating a
reimbursement form of the institution member based on the electronic ticket and the
bill information.
