

ABSTRACT
WORKSHOP ASSISTANCE SYSTEM AND WORKSHOP ASSISTANCE
METHOD

The present invention pertains to a workshop assistance system constituted by a computer comprising a computing device for carrying out prescribed processing, a storage device connected to the computing device, and a communication interface connected to the computing device, the computer being capable of accessing problem case study data including case study information. The workshop assistance system comprises: a problem case study searching module that calculates an evaluation value based on the similarity between problem case study data and text data in which text corresponding to the contents of a discussion by participants is collected and saved into text data by the computing device according to each of preset perspectives; and a problem case study evaluation module by which the computation device determines, on the basis of the rating value, the form in which the problem case study data is outputted.
