(54) Title: A COMPUTER PERIPHERAL

FIG. 1

(57) Abstract: In some aspects, a computer peripheral includes a display; an input interface assembly disposed over the display, a switch arrangement comprising at least one switch disposed between the input interface assembly and the display. The input interface assembly comprises a frame structure and at least one key movably coupled to the frame structure. The at least one key comprises a cap portion having a transparent section configured to permit viewing of information on the display through the transparent section. The at least one key comprises a pusher portion between the cap portion and a pivot mechanism. The pusher portion of the at least one key is aligned to the at least one switch so as to actuate the at least one switch to generate an input signal when the at least one key is depressed to pivot about the pivot mechanism from an undepressed state to a depressed state.
